Project Proposal

Project Title: “Lane Drift”

Group Members:

Moosa Ahmad (25L-3044)

M.Owais Mazhar (25L-3031)

Ali Abdullah (25L-3022)

Introduction:

In this project, we propose the development of "Lane Drift," an engaging 2-D arcade-style game where the player(single/double) navigates a car across a busy three or five-lane highway, dynamically switching lanes to avoid a relentless stream of oncoming traffic. This proposal outlines the technical implementation for a polished and addictive single or two player experience.

Objectives:

- ✧ To navigate a vehicle successfully across a dynamic 3 or 5-lane highway by avoiding collisions with oncoming traffic.
- ✧ To achieve the highest possible score by surviving for the longest duration, with the elapsed time being the direct metric for the player's score

Features and Functionalities:

- ✧ Players can move their vehicles using WASD keys.
- ✧ A point scoring system based on time survived and keeping track of best scores.
- ✧ Detecting collisions with obstacles to end the game.
- ✧ Display a winning message and reset the game for a new round.
- ✧ Support a local multiplayer mode where a second player controls another car.
- ✧ Provide an option to pause/escape at any point during the gameplay.
